11 - my_str_isnum	16
12 - my_str_islower	17
13 - my_str_isupper	18
14 - my_str_isprintable	19
15 - my_putnbr_base	20
16 - my_getnbr_base	21
17 - my_showstr	22
18 - my showmem	23

Instructions

- The subject may change until one hour before turn-in.
- Respect the norm takes time, but is good for you. This way your code will respect the norm since the first written line.
- Ask yourself if it's relevant to let a main() function in your turn-in knowing we will add our own.
- We will compile your files with the command cc *.c, adding our main.c and our my_putchar.c:

```
$> cd ex\_01
$> cc *.c ~moulinette/main_ex_01.c ~moulinette/my_putchar.c -o ex01
$> ./ex01
[...]
```

- This is a turn-in directory, of course you will only keep in it your final work revision. No temporary file should stand there!
 - You shall leave in your directory no other files than those explicitly specified by the exercises.
 - If one of your files prevents the compilation with *.c, the robot will not be able to do the correction and you will have a 0. That is why it's in your interest to remove any file that doesn't work.
- You are only allowed to use the my_putchar function to do the following exercises. This function will be provided, so:
 - You shall not have a my putchar.c file in your turn-in directory.
 - The function my putchar shall not be in any of your turned-in files.
- Don't forget to discuss about it in the pool section of the forum!
- Almost all of these functions exist in the "string" library. To get a full explanation on how a function works, you just need to use man.

Hints For my_strcpy: man strcpy

- Obviously, none of those functions shall contain a function from the "string" library
- Turn-in directory: Piscine_C_J06

Hints

Remember it is always better to create your repository at the beginning of the day and to turn-in your work on a regular basis

Hints

On the instructions of each exercises, this directory is specified for every turn-in path $\,$

Unit Tests

- It is highly recommended to test your functions when you are developing them.
- Usually, it is common to create a function named "main" (and a dedicated file to host it) to check the functions separately.
- Create a directory named "tests".
- Create a function "int main()" in a file named "tests-exercise_name.c", stored inside the directory "tests" previously created.
- According to you, this function must contains all the necessary call to "exercise_name" to cover all possible cases (special or regular) of the function.

Indices

Here is a partial list of tests:

- Check the empty strings
- Pay attention to the possible values of an int
- (0, min and max)

0 - author

- ullet The directory Piscine_C_J06 shall contain a file named auteur with your login followed by a '\n'.
- \bullet Example :

foo_b@moulinette> cat -e auteur
foo_b\$
foo_b@moulinette>

$1 - my_strcpy$

- Write a function that copies a string into another. The destination string will already have enough memory to copy the source string.
- The function shall be prototyped as follows:

```
char *my_strcpy(char *dest, char *src);
```

- It shall return dest.
- Turn-in: Piscine_C_J06/ex_01/my_strcpy.c

Hints Hint: man strcpy

2 - my_strncpy

- Write a function that copies n characters from a string into another. The destination string will already have sufficient memory to contain n characters.
 Add '\0' if n > the length of the string.
 Don't add '\0' if n < the length of the string (because dest is not supposed to contain more than n bytes).
- The function shall be prototyped as follows:

```
char *my_strncpy(char *dest, char *src, int n);
```

- It shall return dest.
- Turn-in: Piscine_C_J06/ex_02/my_strncpy.c

Hints Hint: man strncpy

$3 - my_revstr$

- Write a function that reverse a string.
- The function shall be prototyped as follows:

```
char *my_revstr(char *str);
```

- It shall return str.
- Turn-in: Piscine_C_J06/ex_03/my_revstr.c

4 - my_strstr

- Reproduce the behavior of the function strstr.
- The function shall be prototyped as follows:

```
char *my_strstr(char *str, char *to_find);
```

• Turn-in: Piscine_C_J06/ex_04/my_strstr.c

 ${\it Hints}$ Take a look at the my_strcmp and my_strncmp functions

$5 - my_strcmp$

- Reproduce the behavior of the function strcmp.
- The function shall be prototyped as follows:

```
int my_strcmp(char *s1, char *s2);
```

- It shall return the same values as strcmp(3)
- Turn-in: Piscine_C_J06/ex_05/my_strcmp.c

Hints man 3 strcmp

6 - my_strncmp

- Reproduce the behavior of the function strncmp.
- The function shall be prototyped as follows:

```
int my_strncmp(char *s1, char *s2, int n);
```

- It shall return the same values as strncmp(3)
- Turn-in: Piscine_C_J06/ex_06/my_strncmp.c

$7 - my_strupcase$

- Write a function that sets in uppercase every letter of every word.
- The function shall be prototyped as follows:

```
char *my_strupcase(char *str);
```

- It shall return str.
- Turn-in: Piscine_C_J06/ex_07/my_strupcase.c

$8 - my_strlowcase$

- Write a function that sets in lowercase every letter of every word.
- The function shall be prototyped as follows:

```
char *my_strlowcase(char *str);
```

- It shall return str.
- Turn-in: Piscine_C_J06/ex_08/my_strlowcase.c

$9 - my_strcapitalize$

- Write a function that capitalizes each word.
- The function shall be prototyped as follows:

```
char *my_strcapitalize(char *str);
```

- It shall return str
- Turn-in: Piscine_C_J06/ex_09/my_strcapitalize.c

 $Hints \begin{tabular}{ll} \begin{tabular}{ll$

$10 - my_str_isalpha$

- Write a function that returns 1 if the string passed as parameter contains only alphabetical characters and returns 0 if the string contains another type of characters.
- The function shall be prototyped as follows:

```
int my_str_isalpha(char *str);
```

- It shall return 1 if str is an empty string.
- Turn-in: Piscine_C_J06/ex_10/my_str_isalpha.c

11 - my_str_isnum

- Write a function that returns 1 if the string passed as parameter contains only digits and that returns 0 otherwise
- The function shall be prototyped as follows:

```
int my_str_isnum(char *str);
```

- It shall return 1 if str is an empty string.
- Turn-in: Piscine_C_J06/ex_11/my_str_isnum.c

$12 - my_str_islower$

- Write a function that returns 1 if the string passed as parameter only contains lowercase alphabetical characters and that returns 0 otherwise.
- \bullet The function shall be prototyped as follows:
- int my_str_islower(char *str);
- It shall return 1 if str is an empty string
- Turn-in: Piscine_C_J06/ex_12/my_str_islower.c

$13 - my_str_isupper$

- Write a function that returns 1 if the string passed as parameter only contains uppercase alphabetical characters and that returns 0 otherwise.
- The function shall be prototyped as follows:

```
int my_str_isupper(char *str);
```

- It should return 1 if str is an empty string.
- Turn-in: Piscine_C_J06/ex_13/my_str_isupper.c

$14 - my_str_isprintable$

- Write a function that returns 1 if the string passed as parameter only contains printable characters and that returns 0 otherwise.
- The function shall be prototyped as follows:
- int my_str_isprintable(char *str);
- It should return 1 if str is an empty string.
- Turn-in: Piscine_C_J06/ex_14/my_str_isprintable.c

Hints man isprint

15 - my_putnbr_base

- Write a function that prints a number on the screen, in a given base.
- This number is supplied as an int, and the base is provided as a string
- The base contains all symbols that can be used to print the number:
 - \circ 0123456789 is the decimal base commonly used to represent our numbers
 - o 01 is a binary base
 - \circ 0123456789ABCDEF is an hexadecimal base
- The function shall return the number passed as parameter.
- The function shall handle negative numbers.
- The function shall be prototyped as follows:

```
int my_putnbr_base(int nbr, char *base);
```

• Turn-in:

Piscine_C_J06/ex_15/my_putnbr_base.c

16 - my_getnbr_base

- Write a function that returns a number.
- This number is provided as a string.
- The string expresses the number in a particular base, which is passed as second parameter.
- The function shall handle negative numbers.
- The function shall be able to manage several + or following each others before the number.
- If a parameter contains an error, then the function returns 0.
 - str is an empty string
 - the base is empty
 - \circ str contains characters which are not into the base and that are not + or -
 - the base contains a character more than one time
 - 0 ...
- The function shall be prototyped as follows:

```
int my_getnbr_base(char *str, char *base);
```

• Turn-in:

Piscine_C_J06/ex_16/my_getnbr_base.c

17 - my_showstr

- Write a function that prints a string on screen. If this string contains non-printable characters, they shall be printed as hexadecimal (in lowercase) with a "backslash" before the value.
- The function shall be prototyped as follows:

```
int my_showstr(char *str);
```

- The function always returns 0.
- Turn-in: Piscine_C_J06/ex_17/my_showstr.c

Hints my_showstr("I like\nponies !") prints "I like\0aponies !"

18 - my_showmem

- Write a function that prints a memory area on the screen.
- The output is divided into three columns:
 - The hexadecimal address of the first character of the line.
 - The content in hexadecimal.
 - The content in printable characters.
- If a character is not printable, it shall be replaced by a dot.
- Each line shall handle 16 characters.

```
?>./my_showmem
00000000: 6865 7920 6775 7973 2073 686f 7720 6d65 hey guys show me
                                                  m is cool you ca
00000010: 6d20 6973 2063 6f6f 6c20 796f 7520 6361

00000040: 2e00 0102 0304 0506 0708 090e 0f1b 7f
```

- This function always returns 0.
- The function shall be prototyped as follows:

```
int my_showmem(char *str, int size);
```

Turn-in: Piscine_C_J06/ex_18/my_showmem.c

Hints

Warning: Don't forget the padding if there are not enough characters to have a valid alignment
